

# Protect Coral Reefs Under Climate Change

Oceans are becoming more acidic, making corals more fragile and vulnerable to damage

APN

GLOBAL CHANGE RESEARCH

# How You Can Help

Avoid highly sensitive reef areas, rare species and thin branching corals

Avoid standing or walking on the reef

Avoid snorkelling in really shallow areas

Maintain good buoyancy when diving and **don't touch the coral**

Use moorings buoys to prevent anchor damage

Reduce your carbon footprint

Consider carbon-offsets when travelling
